Denosumab

Policy Number: CS2026D0068X
Effective Date: April 1, 2026

➲ Instructions for Use

Table of Contents **Page**

Commercial Policy
• Denosumab

Application

This Medical Benefit Drug Policy does not apply to the states listed below; refer to the state-specific policy/guideline, if noted:

State	Policy/Guideline
Florida	Refer to the state's Medicaid clinical policy
Indiana	Refer to the state's Medicaid clinical policy
Kansas	Refer to the state's Medicaid clinical policy
North Carolina	None
Ohio	Denosumab (Prolia® & Xgeva®) (for Ohio Only)
Pennsylvania	Refer to the state's Medicaid clinical policy

This Medical Benefit Drug Policy does not apply to the states listed below **for the Prolia product**; refer to the state-specific policy/guideline, if noted:

State	Policy/Guideline
Washington	Refer to the state's Medicaid clinical policy

Coverage Rationale

This policy refers to the following denosumab products:
- Bildyos® (denosumab-nxxp)
- Bilprevda® (denosumab-nxxp)
- Bomyntra® (denosumab-bnht)
- Conexxence® (denosumab-bnht)
- Jubbonti® (denosumab-bbdz)
- Osenvelt® (denosumab-bmwo)
- Prolia® (denosumab)
- Stoboclo® (denosumab-bmwo)
- Wyost® (denosumab-bbdz)
- Xgeva® (denosumab)
- Any FDA-approved denosumab biosimilar not listed here*

*Any U.S. Food and Drug Administration approved and launched denosumab biosimilar product not listed by name in this policy will be considered non-preferred until reviewed by UnitedHealthcare.

Preferred Products

Bildyos®, Bilprevda®, Jubbonti®, and Wyost®, are the preferred denosumab products. Coverage will be provided for Bildyos®, Bilprevda®, Jubbonti®, or Wyost®, contingent on criteria in the Diagnosis-Specific Criteria section.

Coverage for Bomyntra®, Conexxence®, Osenvelt®, Prolia®, Stoboclo®, and Xgeva® are non-preferred products. Coverage for Bomyntra®, Conexxence®, Osenvelt®, Prolia®, Stoboclo®, and Xgeva® are contingent on the Preferred Product Criteria and Diagnosis-Specific Criteria.

Preferred Product Criteria

Treatment with Conexxence®, Prolia®, or Stoboclo® is medically necessary for the indications specified in this policy when both of the criteria below are met:

- **One** of the following:
  - **Both** of the following:
    - History of a trial of adequate dose and duration to **both** of the following, resulting in minimal clinical response and residual disease activity:
      - Bildyos®; **and**
      - Jubbonti®

      and
    - Physician attests that, in their clinical opinion, the clinical response with Conexxence®, Prolia®, or Stoboclo® would be expected to be superior than experienced with the preferred products

    or
  - **Both** of the following:
    - History of contraindication, intolerance, or adverse event to **both** preferred products:
      - Bildyos®; **and**
      - Jubbonti®

      and
    - Physician attests that, in their clinical opinion, the same contraindication, intolerance, or adverse event would not be expected to occur with Conexxence®, Prolia®, or Stoboclo®

  and
- Patient has not had a loss of a favorable response after established maintenance therapy with Bildyos® or Jubbonti®

Treatment with Bomyntra®, Osenvelt®, or Xgeva® is medically necessary for the indications specified in this policy when both of the criteria below are met:

- **One** of the following:
  - **Both** of the following:
    - History of a trial of adequate dose and duration to **both** of the following, resulting in minimal clinical response and residual disease activity:
      - Bilprevda®; **and**
      - Wyost®

      and
    - Physician attests that, in their clinical opinion, the clinical response with Bomyntra®, Osenvelt®, or Xgeva® would be expected to be superior than experienced with the preferred products

    or
  - **Both** of the following:
    - History of contraindication, intolerance, or adverse event to **all** preferred products:
      - Bilprevda®; **and**
      - Wyost®

      and
    - Physician attests that, in their clinical opinion, the same contraindication, intolerance, or adverse event would not be expected to occur with Bomyntra®, Osenvelt®, or Xgeva®

  and
- Patient has not had a loss of a favorable response after established maintenance therapy with Bilprevda® or Wyost®

Diagnosis-Specific Criteria

Bildyos (Denosumab-Nxxp), Conexxence (Denosumab-Bnht), Jubbonti (Denosumab-Bbdz), Prolia (Denosumab), and Stoboclo (Denosumab-Bmwo)

Bildyos, Conexxence, Jubbonti, Prolia, and Stoboclo are proven and medically necessary for the treatment of postmenopausal patients with osteoporosis, or to increase bone mass in patients with osteoporosis at high risk for fracture, who meet all of the following criteria:

- **Initial Therapy**
  - Diagnosis of osteoporosis; **and**
  - **One** of the following:
    - BMD T-score ≤ -2.5 based on BMD measurements from lumbar spine (at least two vertebral bodies), hip (femoral neck, total hip), or radius (one-third radius site); **or**
    - History of **one** of the following resulting from minimal trauma:
      - Vertebral compression fracture; **or**
      - Fracture of the hip; **or**
      - Fracture of the distal radius; **or**
      - Fracture of the pelvis; **or**
      - Fracture of the proximal humerus

      or
    - **Both** of the following:
      - BMD T-score between -1 and -2.5 (BMD T-score greater than -2.5 and less than or equal to -1), based on BMD measurements from lumbar spine (at least two vertebral bodies), hip (femoral neck, total hip), or radius (one-third radius site); **and**
      - **One** of the following:
        - FRAX 10-year fracture probabilities: major osteoporotic fracture at 20% or more; **or**
        - FRAX 10-year fracture probabilities: hip fracture at 3% or more

    and
  - **One** of the following:
    - **Both** of the following:
      - History of intolerance to oral bisphosphonate therapy; **and**
      - History of failure, contraindication, or intolerance to intravenous (IV) bisphosphonate therapy (e.g., pamidronate, zoledronic acid)

      or
    - History of failure or contraindication to oral bisphosphonate therapy; **or**
    - History of failure, contraindication, or intolerance to IV bisphosphonate therapy

    and
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months
- **Reauthorization/Continuation of Care Criteria**
  - Provider attests to a positive clinical response; **and**
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months

Bildyos, Conexxence, Jubbonti, Prolia, and Stoboclo are proven and medically necessary to increase bone mass in patients at high risk for fracture receiving androgen deprivation therapy for non-metastatic prostate cancer in patients who meet all of the following criteria:

- **Initial Therapy**
  - Diagnosis of non-metastatic prostate cancer; **and**
  - Patient is receiving androgen deprivation therapy; **and**
  - **One** of the following:
    - **Both** of the following:
      - History of intolerance to oral bisphosphonate therapy; **and**
      - History of failure, contraindication, or intolerance to intravenous (IV) bisphosphonate therapy (e.g., pamidronate, zoledronic acid)

      or
    - History of failure or contraindication to oral bisphosphonate therapy; **or**
    - History of failure, contraindication, or intolerance to IV bisphosphonate therapy

    and
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months

- **Reauthorization/Continuation of Care Criteria**
  - Patient is receiving androgen deprivation therapy; **and**
  - Provider attests to a positive clinical response; **and**
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months

Bildyos, Conexxence, Jubbonti, Prolia, and Stoboclo are proven and medically necessary to treat patients at high risk for fracture receiving adjuvant aromatase inhibitor therapy for breast cancer in patients who meet all of the following criteria:

- **Initial Therapy**
  - Diagnosis of breast cancer; **and**
  - Patient is receiving aromatase inhibitor therapy; **and**
  - **One** of the following:
    - **Both** of the following:
      - History of intolerance to oral bisphosphonate therapy; **and**
      - History of failure, contraindication, or intolerance to intravenous (IV) bisphosphonate therapy (e.g., pamidronate, zoledronic acid)

      or
    - History of failure or contraindication to oral bisphosphonate therapy; **or**
    - History of failure, contraindication, or intolerance to IV bisphosphonate therapy

    and
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months
- **Reauthorization/Continuation of Care Criteria**
  - Patient is receiving aromatase inhibitor therapy; **and**
  - Provider attests to a positive clinical response; **and**
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months

Bildyos, Conexxence, Jubbonti, Prolia, and Stoboclo are proven and medically necessary to treat glucocorticoid-induced osteoporosis in patients at high risk for fracture when all of the following criteria are met:

- **Initial Therapy**
  - Diagnosis of glucocorticoid-induced osteoporosis; **and**
  - History of prednisone or its equivalent at a dose ≥ 5 mg/day for ≥ 3 months; **and**
  - **One** of the following:
    - BMD T-score ≤ -2.5 based on BMD measurements from lumbar spine (at least two vertebral bodies), hip (femoral neck, total hip), or radius (one-third radius site); **or**
    - History of **one** of the following resulting from minimal trauma:
      - Vertebral compression fracture; **or**
      - Fracture of the hip; **or**
      - Fracture of the distal radius; **or**
      - Fracture of the pelvis; **or**
      - Fracture of the proximal humerus

      or
    - **One** of the following:
      - FRAX 10-year fracture probabilities: major osteoporotic fracture at 20% or more; **or**
      - FRAX 10-year fracture probabilities: hip fracture at 3% or more

    and
  - **One** of the following:
    - **Both** of the following:
      - History of intolerance to oral bisphosphonate therapy; **and**
      - History of failure, contraindication, or intolerance to intravenous (IV) bisphosphonate therapy (e.g., pamidronate, zoledronic acid)

      or
    - History of failure or contraindication to oral bisphosphonate therapy; **or**
    - History of failure, contraindication, or intolerance to IV bisphosphonate therapy

    and
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months

- **Reauthorization/Continuation of Care Criteria**
  - Provider attests to a positive clinical response; **and**
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months

Bilprevda (Denosumab-Nxxp), Bomyntra (Denosumab-Bnht), Osenvelt (Denosumab-Bmwo), Wyost (Denosumab-Bbdz), and Xgeva (Denosumab)

Bilprevda, Bomyntra, Osenvelt, Wyost, and Xgeva are proven and medically necessary for the prevention of skeletal-related events in patients with multiple myeloma and with bone metastases from solid tumors when all of the following criteria are met:

- **Initial Therapy**
  - Patient is **one** of the following:
    - Patient is ≥ 18 years of age; **or**
    - Patient is a skeletally mature adolescent as defined by having at least 1 mature long bone (e.g., closed epiphyseal growth plate of the humerus)

    and
  - **One** of the following:
    - Diagnosis of multiple myeloma; **or**
    - Presence of metastatic disease secondary to a solid tumor (e.g., bladder, breast, kidney, lung, ovarian, thyroid, etc.)

    and
  - Individual has an expected survival of 3 months or greater; **and**
  - Refractory (within the past 30 days), contraindication (including renal insufficiency), or intolerance to treatment with intravenous bisphosphonate therapy (e.g., pamidronate, zoledronic acid); **and**
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months
- **Reauthorization/Continuation of Care Criteria**
  - Individual has an expected survival of 3 months or greater; **and**
  - Provider attests to a positive clinical response; **and**
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months

Bilprevda, Bomyntra, Osenvelt, Wyost, and Xgeva are proven and medically necessary for the treatment of giant cell tumor of the bone when all of the following criteria are met:

- **Initial Therapy**
  - Patient is **one** of the following:
    - Patient is ≥ 18 years of age; **or**
    - Patient is a skeletally mature adolescent as defined by having at least 1 mature long bone (e.g., closed epiphyseal growth plate of the humerus)

    and
  - Diagnosis of localized or metastatic giant cell tumor of the bone; **and**
  - Disease is **one** of the following:
    - Unresectable; **or**
    - Surgical resection is likely to result in severe morbidity

    and
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months
- **Reauthorization/Continuation of Care Criteria**
  - Provider attests to a positive clinical response; **and**
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months

Bilprevda, Bomyntra, Osenvelt, Wyost, and Xgeva are proven and medically necessary for the treatment of hypercalcemia of malignancy when all of the following criteria are met:

- **Initial Therapy**
  - Patient is **one** of the following:
    - Patient is ≥ 18 years of age; **or**
    - Patient is a skeletally mature adolescent as defined by having at least 1 mature long bone (e.g., closed epiphyseal growth plate of the humerus)

and
  - Diagnosis of hypercalcemia of malignancy as defined as albumin-corrected serum calcium level greater than 12.5 mg/dL (3.1 mmol/L); **and**
  - No pre-existing hypocalcemia (i.e., serum calcium or corrected calcium within normal limits per laboratory reference); **and**
  - Refractory (within the past 30 days), contraindication (including renal insufficiency), or intolerance to treatment with intravenous bisphosphonate therapy (e.g., pamidronate, zoledronic acid); **and**
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months
- **Reauthorization/Continuation of Care Criteria**
  - Provider attests to a positive clinical response; **and**
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months

Bilprevda, Bomyntra, Osenvelt, Wyost, and Xgeva are proven and medically necessary for the prevention of skeletal-related events in men with castration-resistant prostate cancer who have bone metastases when all of the following criteria are met:
- **Initial Therapy**
  - Diagnosis of castration-resistant prostate cancer; **and**
  - Presence of metastatic disease; **and**
  - Refractory (within the past 30 days), contraindication (including renal insufficiency), or intolerance to treatment with intravenous bisphosphonate therapy (e.g., pamidronate, zoledronic acid); **and**
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months
- **Reauthorization/Continuation of Care Criteria**
  - Provider attests to a positive clinical response; **and**
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months

Bilprevda, Bomyntra, Osenvelt, Wyost, and Xgeva are proven and medically necessary for the treatment of osteopenia/osteoporosis in patients with systemic mastocytosis with bone pain not responding to bisphosphonates when all of the following criteria are met:
- **Initial Therapy**
  - Diagnosis of systemic mastocytosis; **and**
  - Patient has bone pain; **and**
  - Diagnosis of osteoporosis or osteopenia based on **one** of the following:
    - BMD T-score ≤ -1 based on BMD measurements from lumbar spine (at least two vertebral bodies), hip (femoral neck, total hip), or radius (one-third radius site); **or**
    - History of **one** of the following resulting from minimal trauma:
      - Vertebral compression fracture; **or**
      - Fracture of the hip; **or**
      - Fracture of the distal radius; **or**
      - Fracture of the pelvis; **or**
      - Fracture of the proximal humerus

    and
  - Refractory (within the past 30 days), contraindication (including renal insufficiency), or intolerance to treatment with intravenous bisphosphonate therapy (e.g., pamidronate, zoledronic acid); **and**
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization for no more than 12 months
- **Reauthorization/Continuation of Care Criteria**
  - Provider attests to a positive clinical response; **and**
  - Dosing is in accordance with the United States Food and Drug Administration approved labeling; **and**
  - Authorization is for no more than 12 months

Unproven and Not Medically Necessary

Denosumab, denosumab-bbdz, denosumab-bmwo, denosumab-bnht, and denosumab-nxxp are unproven and not medically necessary for the following indications:
- Combination therapy with intravenous bisphosphonates
- Bone loss associated with hormone-ablation therapy (other than aromatase inhibitors) in breast cancer

- Cancer pain
- Central giant cell granuloma
- Hyper-parathyroidism
- Immobilization hypercalcemia
- Osteogenesis imperfecta
- Osteopenia

Applicable Codes

The following list(s) of procedure and/or diagnosis codes is provided for reference purposes only and may not be all inclusive. Listing of a code in this policy does not imply that the service described by the code is a covered or non-covered health service. Benefit coverage for health services is determined by federal, state, or contractual requirements and applicable laws that may require coverage for a specific service. The inclusion of a code does not imply any right to reimbursement or guarantee claim payment. Other Policies and Guidelines may apply.

HCPCS Code	Description	Brand Name
J0897	Injection, denosumab, 1 mg	Prolia and Xgeva
Q5136	Injection, denosumab (jubbonti/wyost), biosimilar, 1 mg	Jubbonti and Wyost
Q5157	Injection, denosumab-bmwo (Stoboclo/Osenvelt), biosimilar, 1 mg	Stoboclo and Osenvelt
Q5158	Injection, denosumab-bnht (Bomyntra/Conexxence), biosimilar, 1 mg	Bomyntra and Conexxence
Q5162	Injection, denosumab-nxxp (bildyos/bilprevda), biosimilar, 1 mg	Bildyos and Bilprevda

Diagnosis Code	Description
Jubbonti, Prolia, and Stoboclo	
C61	Malignant neoplasm of prostate
C79.81	Secondary malignant neoplasm of breast
M80.00XA	Age-related osteoporosis with current pathological fracture, unspecified site, initial encounter for fracture
M80.00XD	Age-related osteoporosis with current pathological fracture, unspecified site, subsequent encounter for fracture with routine healing
M80.00XG	Age-related osteoporosis with current pathological fracture, unspecified site, subsequent encounter for fracture with delayed healing
M80.00XK	Age-related osteoporosis with current pathological fracture, unspecified site, subsequent encounter for fracture with nonunion
M80.00XP	Age-related osteoporosis with current pathological fracture, unspecified site, subsequent encounter for fracture with malunion
M80.00XS	Age-related osteoporosis with current pathological fracture, unspecified site, sequela
M80.0AXA	Age-related osteoporosis with current pathological fracture, other site, initial encounter for fracture
M80.0AXD	Age-related osteoporosis with current pathological fracture, other site, subsequent encounter for fracture with routine healing
M80.0AXG	Age-related osteoporosis with current pathological fracture, other site, subsequent encounter for fracture with delayed healing
M80.0AXK	Age-related osteoporosis with current pathological fracture, other site, subsequent encounter for fracture with nonunion
M80.0AXP	Age-related osteoporosis with current pathological fracture, other site, subsequent encounter for fracture with malunion
M80.0AXS	Age-related osteoporosis with current pathological fracture, other site, sequela
M80.0B1A	Age-related osteoporosis with current pathological fracture, right pelvis, initial encounter for fracture

Diagnosis Code	Description
Jubbonti, Prolia, and Stoboclo	
M80.0B1D	Age-related osteoporosis with current pathological fracture, right pelvis, subsequent encounter for fracture with routine healing
M80.0B1G	Age-related osteoporosis with current pathological fracture, right pelvis, subsequent encounter for fracture with delayed healing
M80.0B1K	Age-related osteoporosis with current pathological fracture, right pelvis, subsequent encounter for fracture with nonunion
M80.0B1P	Age-related osteoporosis with current pathological fracture, right pelvis, subsequent encounter for fracture with malunion
M80.0B1S	Age-related osteoporosis with current pathological fracture, right pelvis, sequela
M80.0B2A	Age-related osteoporosis with current pathological fracture, left pelvis, initial encounter for fracture
M80.0B2D	Age-related osteoporosis with current pathological fracture, left pelvis, subsequent encounter for fracture with routine healing
M80.0B2G	Age-related osteoporosis with current pathological fracture, left pelvis, subsequent encounter for fracture with delayed healing
M80.0B2K	Age-related osteoporosis with current pathological fracture, left pelvis, subsequent encounter for fracture with nonunion
M80.0B2P	Age-related osteoporosis with current pathological fracture, left pelvis, subsequent encounter for fracture with malunion
M80.0B2S	Age-related osteoporosis with current pathological fracture, left pelvis, sequela
M80.0B9A	Age-related osteoporosis with current pathological fracture, unspecified pelvis, initial encounter for fracture
M80.0B9D	Age-related osteoporosis with current pathological fracture, unspecified pelvis, subsequent encounter for fracture with routine healing
M80.0B9G	Age-related osteoporosis with current pathological fracture, unspecified pelvis, subsequent encounter for fracture with delayed healing
M80.0B9K	Age-related osteoporosis with current pathological fracture, unspecified pelvis, subsequent encounter for fracture with nonunion
M80.0B9P	Age-related osteoporosis with current pathological fracture, unspecified pelvis, subsequent encounter for fracture with malunion
M80.0B9S	Age-related osteoporosis with current pathological fracture, unspecified pelvis, sequela
M80.011A	Age-related osteoporosis with current pathological fracture, right shoulder, initial encounter for fracture
M80.011D	Age-related osteoporosis with current pathological fracture, right shoulder, subsequent encounter for fracture with routine healing
M80.011G	Age-related osteoporosis with current pathological fracture, right shoulder, subsequent encounter for fracture with delayed healing
M80.011K	Age-related osteoporosis with current pathological fracture, right shoulder, subsequent encounter for fracture with nonunion
M80.011P	Age-related osteoporosis with current pathological fracture, right shoulder, subsequent encounter for fracture with malunion
M80.011S	Age-related osteoporosis with current pathological fracture, right shoulder, sequela
M80.012A	Age-related osteoporosis with current pathological fracture, left shoulder, initial encounter for fracture
M80.012D	Age-related osteoporosis with current pathological fracture, left shoulder, subsequent encounter for fracture with routine healing
M80.012G	Age-related osteoporosis with current pathological fracture, left shoulder, subsequent encounter for fracture with delayed healing
M80.012K	Age-related osteoporosis with current pathological fracture, left shoulder, subsequent encounter for fracture with nonunion

Diagnosis Code	Description
Jubbonti, Prolia, and Stoboclo	
M80.012P	Age-related osteoporosis with current pathological fracture, left shoulder, subsequent encounter for fracture with malunion
M80.012S	Age-related osteoporosis with current pathological fracture, left shoulder, sequela
M80.019A	Age-related osteoporosis with current pathological fracture, unspecified shoulder, initial encounter for fracture
M80.019D	Age-related osteoporosis with current pathological fracture, unspecified shoulder, subsequent encounter for fracture with routine healing
M80.019G	Age-related osteoporosis with current pathological fracture, unspecified shoulder, subsequent encounter for fracture with delayed healing
M80.019K	Age-related osteoporosis with current pathological fracture, unspecified shoulder, subsequent encounter for fracture with nonunion
M80.019P	Age-related osteoporosis with current pathological fracture, unspecified shoulder, subsequent encounter for fracture with malunion
M80.019S	Age-related osteoporosis with current pathological fracture, unspecified shoulder, sequela
M80.021A	Age-related osteoporosis with current pathological fracture, right humerus, initial encounter for fracture
M80.021D	Age-related osteoporosis with current pathological fracture, right humerus, subsequent encounter for fracture with routine healing
M80.021G	Age-related osteoporosis with current pathological fracture, right humerus, subsequent encounter for fracture with delayed healing
M80.021K	Age-related osteoporosis with current pathological fracture, right humerus, subsequent encounter for fracture with nonunion
M80.021P	Age-related osteoporosis with current pathological fracture, right humerus, subsequent encounter for fracture with malunion
M80.021S	Age-related osteoporosis with current pathological fracture, right humerus, sequela
M80.022A	Age-related osteoporosis with current pathological fracture, left humerus, initial encounter for fracture
M80.022D	Age-related osteoporosis with current pathological fracture, left humerus, subsequent encounter for fracture with routine healing
M80.022G	Age-related osteoporosis with current pathological fracture, left humerus, subsequent encounter for fracture with delayed healing
M80.022K	Age-related osteoporosis with current pathological fracture, left humerus, subsequent encounter for fracture with nonunion
M80.022P	Age-related osteoporosis with current pathological fracture, left humerus, subsequent encounter for fracture with malunion
M80.022S	Age-related osteoporosis with current pathological fracture, left humerus, sequela
M80.029A	Age-related osteoporosis with current pathological fracture, unspecified humerus, initial encounter for fracture
M80.029D	Age-related osteoporosis with current pathological fracture, unspecified humerus, subsequent encounter for fracture with routine healing
M80.029G	Age-related osteoporosis with current pathological fracture, unspecified humerus, subsequent encounter for fracture with delayed healing
M80.029K	Age-related osteoporosis with current pathological fracture, unspecified humerus, subsequent encounter for fracture with nonunion
M80.029P	Age-related osteoporosis with current pathological fracture, unspecified humerus, subsequent encounter for fracture with malunion
M80.029S	Age-related osteoporosis with current pathological fracture, unspecified humerus, sequela
M80.031A	Age-related osteoporosis with current pathological fracture, right forearm, initial encounter for fracture

Diagnosis Code	Description
Jubbonti, Prolia, and Stoboclo	
M80.031D	Age-related osteoporosis with current pathological fracture, right forearm, subsequent encounter for fracture with routine healing
M80.031G	Age-related osteoporosis with current pathological fracture, right forearm, subsequent encounter for fracture with delayed healing
M80.031K	Age-related osteoporosis with current pathological fracture, right forearm, subsequent encounter for fracture with nonunion

D48.111	Desmoid tumor of chest wall
D48.112	Desmoid tumor, intrathoracic
D48.113	Desmoid tumor of abdominal wall
D48.114	Desmoid tumor, intraabdominal
D48.115	Desmoid tumor of upper extremity and shoulder girdle
D48.116	Desmoid tumor of lower extremity and pelvic girdle

Diagnosis Code	Description
Osenvelt, Wyost, and Xgeva	
D48.117	Desmoid tumor of back
D48.118	Desmoid tumor of other site
D48.119	Desmoid tumor of unspecified site
D48.19	Other specified neoplasm of uncertain behavior of connective and other soft tissue
E83.52	Hypercalcemia

Background

Osteoporosis is characterized by low bone mass, microarchitectural disruption, and increased skeletal fragility. The World Health Organization (WHO) established diagnostic thresholds for bone mineral density (BMD) by dual-energy x-ray absorptiometry (DXA) according to the standard deviation (SD) difference between a patient's BMD and that of a young adult reference population (T-score). A T-score of -2.5 SD or below is defined as osteoporosis, provided that other causes of low BMD have been ruled out, and a T-score between -1 and -2.5 SD is defined as osteopenia. Additionally, guidelines state that osteoporosis can be diagnosed by one of the following: (1) Presence of fragility fractures in the absence of other metabolic bone disorders; (2) T-score ≤ −2.5 SD in the lumbar spine (antero-posterior), femoral neck, total hip, or one-third radius; or (3) T-score between −1.0 and −2.5 and increased fracture risk using the FRAX® (fracture risk assessment tool) country-specific thresholds. The FRAX tool is designed to assist clinicians in predicting the ten-year probability of hip fracture and 10-year probability of a major osteoporotic fracture (spine, forearm, hip, or shoulder fracture) with or without the addition of femoral neck BMD. In the United States, a clinical diagnosis of osteoporosis may be made when the FRAX 10-year probability of major osteoporotic fracture (hip, clinical spine, proximal humerus, or forearm) is greater than or equal to 20 percent or the FRAX 10-year probability of hip fracture is greater than or equal to 3 percent.

Denosumab, denosumab-bbdz, and denosumab-bmwo binds to RANKL, a transmembrane or soluble protein essential for the formation, function, and survival of osteoclasts, the cells responsible for bone resorption, thereby modulating calcium release from bone. Denosumab, denosumab-bbdz, and denosumab-bmwo prevents RANKL from activating its receptor, RANK, on the surface of osteoclasts, their precursors, and osteoclast-like giant cells. Prevention of the RANKL/RANK interaction inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption and increasing bone mass and strength in both cortical and trabecular bone. Increased osteoclast activity, stimulated by RANKL, is a mediator of bone pathology in solid tumors with osseous metastases. Similarly, giant cell tumors of bone consist of stromal cells expressing RANKL and osteoclast-like giant cells expressing RANK receptor and signaling through the RANK receptor contributes to osteolysis and tumor growth.

Clinical Evidence

Jubbonti, Prolia, and Stoboclo

Postmenopausal Patients With Osteoporosis

In a post-hoc analysis of the 7-year FREEDOM Extension trial, Kendler et al., analyzed whether women who experienced fracture while on denosumab was due to inadequate treatment response, or whether the risk of fracture remains low while continuing denosumab treatment. During the extension trial, all study participants were to receive denosumab. The authors of this analysis compared subsequent osteoporotic fracture rates between denosumab treated subjects during the initial FREEDOM or the extension and placebo-treated subjects in FREEDOM. During FREEDOM, 438 placebo- and 272 denosumab-treated subjects had an osteoporotic fracture. Exposure-adjusted subject incidence per 100 subject-years was lower for denosumab (6.7) vs. placebo (10.1). Combining all subjects on denosumab from FREEDOM and the Extension for up to 10 years (combined denosumab), 794 (13.7%) had an osteoporotic fracture while on denosumab. One or more subsequent fractures occurred in 144 (18.1%) subjects, with an exposure-adjusted incidence of 5.8 per 100 subject-years, similar to FREEDOM denosumab (6.7 per 100 subject-years) and lower than FREEDOM placebo (10.1 per 100 subject years). Adjusting for prior fracture, the risk of having a subsequent on-study osteoporotic fracture was lower in the combined denosumab group vs. placebo [hazard ratio (95% CI): 0.59 (0.43-0.81); p = 0.0012]. The authors concluded that the post-hoc analysis demonstrates that denosumab decreases the risk of subsequent fracture and a fracture sustained while on denosumab, and not necessarily due to inadequate treatment response.

Brown JP et al. compared the efficacy and safety of denosumab with alendronate in postmenopausal women with low bone mass in a phase 3, multicenter, double-blind study. Participants included postmenopausal women with a T-score ≤ -2.0 at the lumbar spine or total hip and received subcutaneous denosumab injections [60 mg every 6 months (Q6M)] plus oral placebo weekly (n = 594) or oral alendronate weekly (70 mg) plus subcutaneous placebo injections Q6M (n = 595).

Efficacy was measured by assessing changes in BMD at the total hip, femoral neck, trochanter, lumbar spine, and one-third radius at 6 and 12 months. Additionally, bone turnover markers at months 1, 3, 6, 9, and 12 were assessed. Adverse events were monitored to evaluate safety. Denosumab significantly increased BMD at month 12 (3.5% versus 2.6%; $p < 0.0001$ for the total hip). Significantly greater increases in BMD were observed with denosumab at all measured skeletal sites over the twelve-month treatment period. Denosumab showed significantly greater reduction of bone turnover markers compared to alendronate. Adverse events and laboratory values were similar for the two treatment groups. The authors conclude that denosumab showed a significantly larger gain in BMD and greater reduction in bone turnover markers compared with alendronate. Overall, the safety profile was similar for both treatment groups.

Men With Low Bone Mineral Density

Langdahl BL et al. evaluated denosumab therapy in men with low bone mineral density (BMD) in a multicenter, phase 3 study. The study consisted of 2 treatment periods including a 12-month double-blind, placebo-controlled phase and a 12-month open-label phase. Participants from the original denosumab (long-term) and placebo (crossover) groups received 60 mg of denosumab subcutaneous every 6 months. During the open-label phase, the following BMD increases occurred with long-term denosumab treatment (2.2% lumbar spine, 0.9% total hip, 1.3% femoral neck, 1.3% trochanter, and 0.2% 1/3 radius), resulting in cumulative 24-month gains from baseline of 8.0%, 3.4%, 3.4%, 4.6%, and 0.7%, respectively (all $p < .01$). The crossover group showed BMD gains similar to the long-term treatment group during the first 12 months of treatment. Similar adverse event rates were seen in both groups. The authors conclude that in the study population, denosumab treatment for a second year continued to increase BMD, maintained reductions in bone resorption, and was well tolerated. These results were similar to previous results in postmenopausal women with osteoporosis and in men with prostate cancer receiving androgen deprivation therapy.

Orwoll E. et al. evaluated the safety and efficacy of denosumab compared with placebo in men with low BMD after 1 year of treatment in a placebo-controlled, phase 3 study. The primary endpoint was the percent change of BMS from baseline in lumbar spine (LS) at one year. After 12 months, denosumab resulted in BMD increases of 5.7% at the LS, 2.4% at the total hip, 2.1% at the femoral neck, 3.1% at the trochanter, and 0.6% at the one third radius (adjusted $p \leq 0.0144$ for BMD percent differences at all sites compared with placebo). The incidence of adverse events was similar between groups. The authors conclude that 12 months of treatment with denosumab in men with low BMD was well tolerated and resulted in a reduction in bone resorption and significant increases in BMD at all skeletal sites assessed.

Patients at High Risk for Fracture Receiving Androgen Deprivation Therapy for Non-Metastatic Prostate Cancer

Smith ME et al. investigated the effects of denosumab in a double-blind, multicenter study, on bone mineral density and fractures in patients with non-metastatic prostate cancer who are receiving androgen-deprivation therapy. Patients were randomly assigned to receive denosumab at a dose of 60 mg subcutaneously every 6 months or placebo ($n = 734$ per group). The primary end point was percent change in bone mineral density at the lumbar spine at 24 months. Secondary end points included percent change in bone mineral densities at the femoral neck and total hip at 24 months and at all three sites at 36 months, as well as frequency of new vertebral fractures. At 24 months, patients receiving denosumab experienced an increase in bone mineral density of the lumbar spine by 5.6% as compared with a loss of 1.0% in the placebo group ($p < 0.001$). Significant differences between the placebo and denosumab groups were seen at 1 month and continued through 36 months. Treatment was also associated with significant increases in bone mineral density at the total hip, femoral neck, and distal third of the radius. Patients who received denosumab had a decreased incidence of new vertebral fractures at 36 months (1.5%, vs. 3.9% with placebo) (relative risk, 0.38; 95% confidence interval, 0.19 to 0.78; $p = 0.006$). Similar rates of adverse events were reported in the two groups. The authors conclude that denosumab is associated with increased bone mineral density at all sites and a reduction in the incidence of new vertebral fractures among patients receiving androgen-deprivation therapy for non-metastatic prostate cancer. (ClinicalTrials.gov number NCT00089674).

Glucocorticoid-Induced Osteoporosis in Patients at High Risk for Fracture

Saag et al. assessed the efficacy and safety of denosumab compared with risedronate in glucocorticoid-induced osteoporosis in a 24-month, double-blind, active-controlled, double-dummy, non-inferiority study. The study enrolled patients aged 18 years or older who were receiving ≥ 7.5 mg prednisone daily or equivalent, for at least 3 months (glucocorticoid continuing) or less than 3 months (glucocorticoid initiating). Patients under 50 years of age were required to have a history of osteoporosis-related fracture. Patients 50 years and older needed a lumbar spine, total hip, or femoral neck bone mineral density T score of -2.0 or less, or -1.0 or less if they had a history of osteoporosis-related fracture. Study patients received either 60 mg subcutaneous denosumab every 6 months and oral placebo daily for, or 5 mg oral risedronate daily and subcutaneous placebo every 6 months for 24 months. The primary outcome was non-inferiority of denosumab to risedronate in terms of percentage change from baseline in lumbar spine bone mineral density at 12 months based on non-inferiority margins. In addition, superiority was also assessed. The safety analysis included all study

patients who received one dose or more of their assigned investigational product. This study is registered with ClinicalTrials.gov (NCT01575873). Denosumab was both non-inferior and superior to risedronate at 12 months for effect on bone mineral density at the lumbar spine in both glucocorticoid-continuing [4.4% (95% CI 3.8-5.0) vs. 2.3% (1.7-2.9); p < 0.0001] and glucocorticoid-initiating [3.8% (3.1-4.5) vs. 0.8% (0.2-1.5); p < 0.0001] sub-populations. Incidence of adverse events and fractures was similar between treatment groups. The most common adverse events in both groups included back pain and arthralgia. Serious infection occurred in 15 (4%) patients in the risedronate group and 17 (4%) patients in the denosumab group. The authors conclude that denosumab could be a useful treatment option for patients taking glucocorticoids who are at risk for fractures.

Osenvelt, Wyost, and Xgeva

In an ad hoc analysis of the phase 3 clinical trial of 1,776 patients with metastases from solid tumors or multiple myeloma, where it was shown that denosumab was non-inferior to zoledronic acid (ZA) in delaying or preventing SREs, Henry et al. reports outcomes in the subgroup of 1,597 patients with solid tumors, excluding multiple myeloma. In the ad hoc analysis, denosumab significantly delayed time to first on-study SRE compared to ZA (HR, 0.81; 95% CI, 0.68-0.96) and time to first-and-subsequent SREs (RR, 0.85; 95% CI, 0.72-1.00). Denosumab also significantly delayed time to development of moderate or severe pain (HR, 0.81; 95% CI, 0.66-1.00), pain worsening (HR, 0.83; 95% CI, 0.71-0.97), and worsening pain interference in patients with no/mild baseline pain (HR, 0.77; 95% CI, 0.61-0.96). Overall survival was similar in both groups. The median KM estimate was 10.7 months for denosumab-treated patients and 10.0 months for ZA-treated patients (HR, 0.92; 95% CI, 0.81-1.05: p = 0.215). Similarly, there was no difference between groups in time to disease progression. The median KM estimate was 5.3 (4.9, 5.7) months for denosumab-treated and 5.4 (4.8, 5.7) months for ZA-treated patients (HR, 0.96; 95% CI, 0.85-1.08: p = 0.497). The authors concluded that denosumab was more effective in delaying the incidence of SREs, however, did not significantly affect the overall incidence or disease progression or overall survival.

In a double-blind, double-dummy, phase III clinical trial, Henry et al. compared denosumab with zoledronic acid (ZA) for delaying or preventing skeletal-related events (SRE) in patients with advanced cancer and bone metastases (excluding breast and prostate) or myeloma. Patients were randomly assigned to receive either monthly subcutaneous denosumab 120 mg (n = 886) or intravenous ZA 4 mg (dose adjustment for renal impairment; n = 890). The primary end point was time to first on-study SRE (pathologic fracture, radiation or surgery to bone, or spinal cord compression). The trial demonstrated that denosumab was noninferior to ZA in delaying time to first on-study SRE (hazard ratio, 0.84; 95% CI, 0.71 to 0.98; p = 0.0007). Denosumab was not statistically superior to ZA in delaying time to first on-study SRE (p = 0.03 unadjusted; p = 0.06 adjusted for multiplicity) or time to first-and-subsequent (multiple) SRE (rate ratio, 0.90; 95% CI, 0.77 to 1.04; p = 0.14). Overall survival and disease progression were similar between groups. Hypocalcemia occurred more frequently with denosumab. Osteonecrosis of the jaw occurred at similarly low rates in both groups. Acute-phase reactions after the first dose occurred more frequently with ZA, as did renal adverse events and elevations in serum creatinine. The authors concluded that denosumab was noninferior to ZA in preventing or delaying first on-study SRE in patients with advanced cancer metastatic to bone or myeloma.

Fizazi et al. evaluated the comparison of denosumab with zoledronic acid (ZA) for the prevention of skeletal-related events in men with bone metastases from castration-resistant prostate cancer. In a phase 3 clinical study, 1,904 men with castration-resistant prostate cancer had no previous exposure to IV bisphosphonate were randomized 1:1 to either receive 120 mg subcutaneous denosumab plus IV placebo (n = 950), or 4 mg IV ZA plus subcutaneous placebo (n = 951) every 4 weeks. The primary endpoint was time to first on-study skeletal related event (pathological fracture, radiation therapy, surgery to bone, or spinal cord compression), and was assessed for non-inferiority. The same outcome was further assessed for superiority as a secondary endpoint. Efficacy analysis was by intention to treat. Median time to first on-study skeletal-related event was 20.7 months (95% CI 18.8-24.9) with denosumab compared with 17.1 months (15.0-19.4) with zoledronic acid (hazard ratio 0.82, 95% CI 0.71-0.95; p = 0.0002 for non-inferiority; p = 0.008 for superiority). While there was a three-month increase in the time to first skeletal-related events observed with denosumab in men with prostate cancer, there was no clinically meaningful difference in skeletal-related events for denosumab as compared with zoledronic acid: Overall confirmed events (ZA vs. denosumab) 41% vs. 36%; radiation to bone (21% vs. 19%); pathological fracture (15% vs. 14%); spinal cord compression (4% vs. 3%); surgery to bone (< 1% vs. < 1%). The authors concluded that denosumab was better than ZA for delaying the time to first SRE, however, was not significantly better at preventing the overall incidence of SREs versus zoledronic acid.

Professional Societies

National Comprehensive Cancer Network Clinical Practice Guidelines in Oncology (NCCN Guidelines®)

Several National Comprehensive Cancer Network Clinical Practice Guidelines in Oncology (NCCN Guidelines®) include denosumab as a treatment for several conditions related to malignant disease. The following NCCN Guidelines® state:

- For non-small cell lung cancer, the NCCN recommends (Category 2A) denosumab to be considered in patients with bone metastases.
- For ductal carcinoma, invasive breast cancer or inflammatory breast cancer, the NCCN recommends (Category 2A) denosumab to be considered in postmenopausal (natural or induced) patients receiving adjuvant aromatase inhibition therapy along with calcium and vitamin D supplementation to maintain or improve bone mineral density and reduce risk of fractures.
- For invasive or inflammatory breast cancer, the NCCN recommends (Category 1) denosumab to be used with calcium and vitamin D supplementation in addition to chemotherapy or endocrine therapy for bone metastasis in patients with expected survival ≥ 3 months with adequate renal function.
- For kidney cancer, the NCCN recommends (Category 2A) denosumab to be used as a component of best supportive care for bony metastases.
- For systemic mastocytosis, the NCCN recommends (Category 2A) denosumab as second-line therapy for osteopenia/osteoporosis in patients with bone pain not responding to bisphosphonates or for patients who are not candidates for bisphosphonates because of renal insufficiency.
- For thyroid carcinoma (anaplastic, follicular, medullary, oncocytic, papillary), the NCCN recommends (Category 2A) denosumab to be considered for bone metastases or palliative care for bone metastases (anaplastic).
- For giant cell tumor of the bone, the NCCN recommends (Category 2A) denosumab as a single agent or combined with serial embolization (preferred), and/or radiation therapy for resectable disease with unacceptable morbidity and/or unresectable axial lesions for patients with localized disease, metastases at presentation, or recurrence. Denosumab is also recommended (Category 2A) as preferred therapy as a single agent for unresectable metastatic disease, unresectable metastatic recurrence or considered prior to surgery for resectable local recurrence.
- For prostate cancer, the NCCN recommends (Category 2A) denosumab for treatment-related bone loss in those receiving adrogen deprivation therapy (ADT) when the absolute fracture risk warrants drug therapy. Denosumab is also recommended (Category 1) as a preferred treatment option for the prevention of symptomatic skeletal-related events (SREs) in M1 castration-resistant prostate cancer (CRPC) if bone metastases are present.
- For multiple myeloma, the NCCN recommends (Category 2A) denosumab to be used in combination with primary myeloma therapy and is the preferred agent in patients with renal insufficiency.

U.S. Food and Drug Administration (FDA)

This section is to be used for informational purposes only. FDA approval alone is not a basis for coverage.

Bildyos (denosumab-nxxp), Conexxence (denosumab-bnht), Jubbonti (denosumab-bbdz), Stoboclo (denosumab-bmwo), and Prolia (denosumab) are RANK ligand inhibitors indicated for the following uses:
- Treatment of postmenopausal women with osteoporosis at high risk for fracture, defined as a history of osteoporotic fracture, or multiple risk factors for fracture; or patients who have failed or are intolerant to other available osteoporosis therapy. In postmenopausal women with osteoporosis, Prolia reduces the incidence of vertebral, nonvertebral, and hip fractures.
- Treatment to increase bone mass in men with osteoporosis at high risk for fracture, defined as a history of osteoporotic fracture, or multiple risk factors for fracture; or patients who have failed or are intolerant to other available osteoporosis therapy.
- Treatment of glucocorticoid-induced osteoporosis in men and women at high risk of fracture who are either initiating or continuing systemic glucocorticoids in a daily dosage equivalent to 7.5 mg or greater of prednisone and expected to remain on glucocorticoids for at least 6 months. High risk of fracture is defined as a history of osteoporotic fracture, multiple risk factors for fracture, or patients who have failed or are intolerant to other available osteoporosis therapy.
- Treatment to increase bone mass in men at high risk for fracture receiving androgen deprivation therapy for nonmetastatic prostate cancer. In these patients Prolia also reduced the incidence of vertebral fractures.
- Treatment to increase bone mass in women at high risk for fracture receiving adjuvant aromatase inhibitor therapy for breast cancer.

Bilprevda (denosumab-nxxp), Bomyntra (denosumab-bnht), Osenvelt (denosumab-bmwo), Wyost (denosumab-bbdz), and Xgeva (denosumab) are RANK ligand inhibitor indicated for the following uses:
- Prevention of skeletal-related events in patients with multiple myeloma and in patients with bone metastases from solid tumors.
- The treatment of adults and skeletally mature adolescents with giant cell tumor of bone that is unresectable or where surgical resection is likely to result in severe morbidity.
- Treatment of hypercalcemia of malignancy refractory to bisphosphonate therapy.
